Homepage banners

`/admin/banners` manages the existing `siteSettings/storeContent.banners` array (maximum six). The existing `homeBannerMedia` registry, signed Cloudinary upload and trusted metadata verifier remain authoritative. No second banner source, migration, dependency, function, composite index or rule publication is introduced.

Saving and identity

Banner IDs are stable 32-character references, never array offsets. Array order is shared across desktop and mobile. Dragging or Move Up/Down changes only a local pending order. Save Order requires confirmation; Cancel Order restores the saved sequence. Search/status filters do not change the underlying order; drag is disabled while filtered.

`banners:get`, `banners:save` and `banners:preview` reuse `/api/catalog`. All require the administrator claim AND enabled `adminAccess/{uid}` record. Writes recheck the record inside the Firestore transaction. `banners:save` merges banner fields and revision metadata only; contact details, policies, featured sections, returns configuration and unknown unrelated fields are preserved. A shared revision rejects concurrent website/banner writes. The operation ID/hash/actor make identical uncertain-response retries safe; stale retries cannot create another banner. Conflicts keep the editor intact: copy/review edits, then explicitly discard and reload the current saved list before reapplying them.

Website/contact saves preserve unchanged saved banners, including their schedule. They do not require an already-saved campaign destination to remain live just to save unrelated website content. There is no destructive media operation: Remove deletes the banner reference only; replaced/removed Cloudinary media remains stored.

Compatibility, images and schedule

Legacy `{id,title,link,enabled,images}` entries remain valid: continuous schedule, title overlay, Explore label for a saved link. New optional fields are `name` (private internal reference), `supportingText`, `showButton`, `buttonLabel`, `placement`, `startsAt`, `endsAt`. Optional overlay text can be blank. Show Button off suppresses the visual CTA and hides its editor controls while retaining the saved selection. Whole-slide navigation follows the November 2026 rules below.

The existing 768px breakpoint, desktop 8:3 and mobile square crop are retained. Recommended artwork is 1920 × 720 desktop and 900 × 900 mobile; the Stitch export inconsistently labels 1600 × 600 as 16:9 and suggests a different mobile crop. Preserving the actual storefront proportions takes precedence. Focal values are persisted integer percentages. Mobile uses its own picture source, falling back to desktop when absent; a failed image retains layout space and usable text/button. Verified JPEG/PNG/WebP limit is 10 MiB, using existing purpose/device/uploader-bound tickets; client URLs are never verification evidence. Selecting/uploading media does not publish changes.

Schedule entry/display is Asia/Kolkata; storage uses UTC epoch milliseconds. Disabled takes precedence; otherwise end is exclusive, start inclusive, yielding Ended/Scheduled/Live. Trusted server time determines public eligibility. Public data includes only eligible rendering fields, never internal names, operation metadata, media IDs or disabled/future settings.

The existing public content API remains `private, no-store`. Open pages revalidate within 15 seconds, at a known schedule boundary, and on window focus; refresh/revisit fetches the saved result immediately. Requests are sequenced so older responses cannot overwrite newer ones. A failed refresh clears banner data rather than retaining potentially expired promotions. No administrator visit or scheduler activates/ends a banner.

Destinations and homepage

Searchable Campaign/Category/Product choices derive links from stable records and actual routes: `/sale/{slug}`, `/collections/{slug}`, `/product/{slug}`, `/shop`. Valid existing HTTPS destinations remain compatible; new structured choices use internal routes. Campaign links must be published and the entire enabled banner window must fall inside the campaign window. Future campaigns require a corresponding future banner start; a finite campaign end requires a banner end no later than it. The editor never publishes/pauses a campaign. Category targets must be enabled; product targets must be Published within an enabled category. Broken/ambiguous internal targets fail validation. Existing banner entries expose an admin suppression reason when targets become unavailable.

Public reads recheck destinations. Paused/ended campaigns and hidden/missing products/categories suppress the banner; shoppers are not redirected to a broken collection. A campaign banner remains linked to its campaign even without a visual CTA; other whole-slide banners link to Shop Sarees. Legacy external HTTPS targets are syntax-validated; external availability cannot be guaranteed by the store.

Eligible banners appear in saved order in the homepage carousel. Zero leaves the existing neutral homepage fallback; one has no redundant navigation; multiple have five-second autoplay, previous/next, direct slide selection and Pause/Play. Autoplay pauses on hover, focus, hidden tabs and reduced-motion preference. Preview is administrator-only and non-navigating: inline edits and private responsive preview are clearly labelled unpublished. Saved Homepage Preview includes currently Live, destination-eligible saved entries.

Validation and release

New focused checks: `src/content/model.test.ts`, `scripts/banners-emulator.test.ts`, `scripts/banners-browser.test.py` with loopback-only `scripts/banners-fixture-control.ts`. They are integrated into the existing `test:admin` harness. Emulator fixtures/media are not production data.

Local validation covers shared-field preservation, concurrent revisions, idempotent retry, order, legacy input, trusted media/purpose, destination eligibility, exact schedule boundaries, public projection, direct-rule denial, upload recovery, private preview, search/empty/error/retry, saved IST values, responsive editor/list and zero/one/multiple homepage banners. Campaign and business regressions remain applicable. Runtime packaging is separate from the frontend build.

Release requires the owner's normal application commit/push/deployment and hosted acceptance using existing authorized sessions: real signed uploads, saved homepage refresh, responsive artwork, destination visibility and schedules. No production state was inspected or changed during implementation; local/emulator results do not establish hosted acceptance. No new Firebase rules/index deployment is required by these query shapes.

Whole-slide navigation and campaigns (November 2026)

See `CAMPAIGNS.md` for the shared active-campaign provider, automatic hero projection/deduplication, expiry refresh and conditional Sale navigation. Normal saved hero slides open Shop Sarees; live campaign destinations override that default. Campaign links remain in the public projection even when the visual CTA is hidden, and campaign availability is checked independently of that CTA setting. No nested anchors, new carousel dimensions, image changes or saved banner reordering are introduced. Existing destination-validation checks for regular saved references remain intact. Keyboard activation and horizontal swipes are tested separately from arrows/pagination/pause. No production banner/campaign data is needed for acceptance tests.
