Customer Profile / My Account

Local implementation of the approved desktop and mobile account designs at `/account`. Existing storefront header, logo, footer and five-tab navigation are retained. The signed-in account no longer uses the login portrait composition; signed-out sign-in/registration and administrator-managed login imagery remain.

Sources and writes

Data	Authoritative source / operation
Sign-in email and session	Firebase Authentication; email is read-only
Name / contact mobile	`customerProfiles/{uid}`; trusted `profile:update`
Initial profile recovery	Existing `ensureCustomerProfile` / pending profile flow
Saved addresses	`customerShopping/{uid}/addresses` and existing address APIs
Default address	Single `customerShopping/{uid}/preferences/delivery` pointer
Points and current redemption value	Existing `loyalty:account` response
Paginated ledger	Existing `loyalty:customerHistory` response

Every protected API derives the UID from the verified token. No profile UI UID, email, claim or browser storage flag grants access. Existing Firestore owner-only reads and direct-write restrictions remain unchanged. No email/phone verification, email/password change, new balance store or new profile collection was added.

Profile saves update only allowed name/mobile fields and the established derived directory synchronization, preserving unrelated fields. `expectedProfile` is an optional backwards-compatible guard comparing the name/mobile snapshot in the server transaction. The new editor supplies it. Conflicts retain edits and offer explicit reload; an identical save whose response was lost can be retried safely. Normal profile edits retain the existing source-profile path; Firebase Auth display-name synchronization remains in the established registration/recovery flow. Historical orders and addresses are never rewritten by account edits.

Three-address policy and legacy books

`ADDRESS_LIMIT` is now three, shared by Profile, Checkout and the trusted delivery service. Creation checks the full personal collection inside the transaction that also reads/writes the default pointer. Simultaneous creates cannot bypass the cap. Operation receipts preserve retry identity, including the optional `makeDefault` boolean. Profile address saves can atomically set the default; older clients may omit this optional field and retain their previous behavior.

Listing and subscriptions do not truncate or reject legacy books above three. All existing entries remain accessible for edit, deletion and default management; creation is blocked until fewer than three remain. Existing document fields are merged on edit. Deleting the default reuses the existing deterministic replacement pointer; no competing per-address default flags were introduced. No migration or automatic deletion is needed.

UI and supporting states

- Customer-derived initials and greeting; neutral initials when no name exists.
- Personal details and read-only email; completion action for missing legacy phone.
- Name/mobile dialog with existing phone parsing, default +91 for unset numbers, field errors, sending lock, server-confirmed success, retry, conflict reload and discard confirmation only for actual dirty input.
- Shared address editor and confirmed deletion, presented as desktop dialogs/mobile sheets only in Profile. Existing Checkout presentation is preserved.
- Available points use the API value. Pending and reserved points remain separate. Current worth is shown only when configured and enabled. Disabled programs retain balance/history access; disabled empty programs omit promotional UI. Loading/error states never masquerade as zero balances. Redemption remains in Checkout.
- History shows actual types, changes, pending/reserved deltas, reasons, IST dates and existing order links, with cursor pagination and a working return to page one.

- My Orders, Help & Contact and Sign out reuse existing destinations/auth flow.
- Native dialogs provide focus containment/restoration and Escape. Dirty inputs are local to the form and survive background refresh/tab focus. Account changes unmount private forms and clear private state; stale responses are ignored.

Profile CSS is scoped to `.customer-profile`. No global sizing, Admin styling, Home, Shop, Wishlist, Checkout or order-screen redesign is included.

Necessary differences from Stitch

The existing storefront chrome, logo and local Lora are retained. Fictional membership numbers, tiers, verification badges, certification, insurance, packaging, concierge benefits and support promises are omitted. Real ledger amounts, address counts and recipient/contact details replace the prototype records. India delivery fields and existing phone-country handling remain; no Maps, geolocation or address-autofill integration was added. More than three legacy addresses are explicitly preserved, rather than forcing the prototype's three-card view.

Validation and release

Focused validation includes typecheck, unit tests, production build, the updated delivery and business emulator suites, profile functional acceptance, existing shared delivery/Checkout and login-appearance browser regressions, and a final layout smoke at 320, 390, 768 and 1440px. These cover transactional creation races, exact retries, defaults/deletion, seven-address legacy fixtures, field protection, profile conflicts and unrelated-field preservation, historical order-address preservation, point errors/zero/disabled/history pagination, sign-out/account isolation, dirty forms/focus and long content. All mutations use loopback emulators. Typecheck, all 143 unit tests and the production build pass. Both emulator suites and all four browser groups pass; completed checks were reused during the final layout-only pass. The build retains its existing bundle-size advisory.

Screenshots are under `.cache/profile-design/`: `account-{width}.png`, `edit-details-{width}.png` and `address-sheet-390.png`. The two `comparison-account-{390,1440}.png` artifacts compare the respective exports with the local account at equivalent CSS widths; simulator controls are removed only from reference captures. Full-page images preserve viewport-fixed navigation.

No new dependencies, credentials, rules, indexes, uploads or production migration are required. Release must include the updated frontend **and** server code so the three-address cap is enforced in production. Hosted acceptance remains for the owner after release. Local emulator results do not establish hosted behavior. Nothing was committed, pushed, deployed, published or changed in production.
