Approved customer homepage

Implemented from the supplied mobile Stitch screenshot, HTML and DESIGN.md. No separate desktop screenshot was supplied: desktop uses the same section order, with a four-column product grid, three campaign cards and a split spotlight. Admin shell, typography sizing and business workflows are unchanged.

Section mapping

Design section	Existing source and behavior
Header / five bottom tabs	Shared customer Header and MobileBottomNav, approved `parinaya_logo.png`, existing routes and actual shopping counts. Mobile header contains Menu, brand and Search only. Desktop adds navigation, Wishlist, Bag and Account.
Hero	Existing `siteSettings/storeContent.banners` public projection. Saved order, enabled state, schedule and destination validation stay server-controlled. Zero banners shows a neutral Shop link, never a sample photograph.
Shop by collection	Existing `featuredCategoryIds` and eligible public `featuredCategories`, in saved order. Artwork is the first matching eligible product cover in the loaded public catalogue; a neutral icon is used when none is loaded. No category image fields or sample categories are created.
Information strip	Removed at every viewport. Shop, Shipping Policy and Contact remain in navigation/footer.
New Arrivals	Four newest eligible published products from the existing browse API (`sort=newest`, descending ID tie-break), not a new collection. New Arrival badges appear only when the saved product flag is present. View All opens Shop.
Occasion Curations	First three live campaigns from the existing public campaign list, retaining saved display order. Links use permanent campaign slugs. No campaign-based pricing or new discounts are introduced.
Curator's Spotlight	First eligible existing homepage `featuredProductIds` assignment. Uses that product's real cover, name, description and product destination. Hidden when no eligible assignment exists. Other assignment records are preserved.
Story card	Saved public About Us heading and introduction, falling back to its first story paragraph. Hidden when About Us has never been explicitly saved. Links to the existing About page.
Footer	Existing `footer-brand`, `footer-support`, public Contact Information, social links and configured WhatsApp behavior. Homepage-only compact footer; other storefront pages retain their existing footer.

No loyalty promotion appears in the approved design, so none is added. Existing account balances and checkout redemption remain untouched; the homepage makes no loyalty account requests.

Small editable copy extension

Two bounded HomeText entries are added to the existing Website Content registry and editor:

- **New Arrivals Section** → `textSections.home-new-arrivals`.
- **Occasion Curations Section** → `textSections.home-campaigns`.

Both use the existing heading/supportingText/description fields, private source document, revision checks, dual administrator authorization and narrow public projection. Missing entries use neutral section labels. Explicitly blank saved headings remain blank. Featured Sarees Section (`home-featured`) supplies spotlight copy; Shop by Category (`home-categories`) retains category-rail copy. No alternate CMS, sidebar section, new upload facility, migration or read-side initialization is added.

Necessary differences from prototype

- The prototype's “100% Online Payments Only / No COD” block is incorrect for this application. The matching footer panel states the actual COD behavior and that online payments are unavailable. Checkout/payment logic is unchanged.
- Certification, pure-gold-zari, insurance, video appointments and limited-stock promises are omitted unless present in actual saved content. Sample names, descriptions, prices, badges, contact details and pictures are not application fallbacks.
- Variant products use **Choose colour**, unavailable products disable Add, and accepted shopping changes use the existing confirmation/retry notices. Product links stay usable while actions are pending. Wishlist buttons are independent of product links.
- All application-owned customer text uses the existing local Lora variable font (400-700), including headings, controls, navigation and forms. SVGs, icon fonts, logos and image typography are preserved. Admin keeps its existing typography. No new font CDN or scripts are added. Existing site metadata, canonical handling and analytics are preserved.
- Primary touch controls have at least 44px height even where the export uses smaller controls. The exact five tabs are Home, Shop, Wishlist, Bag and Account.

Artwork and responsive behavior

Product cards reserve a strict **3:4** image cell and use cover sizing, preserving the native proportions of 960 × 1280 saree proportions. Lazy-loaded images do not expand the cell through their intrinsic dimensions. Images that fail show a neutral placeholder.

Hero desktop retains **8:3** (1600 × 600). Public mobile uses a responsive **4:5** portrait frame below 768px: 400px tall at 320px width and 487.5px at 390px. The shared Admin mobile banner preview and homepage upload preview use the same 4:5 crop; recommended artwork is **1080 x 1350px**. Desktop keeps its existing 8:3 dimensions. Existing portrait/square uploads are cropped more at top/bottom; their saved focal point remains authoritative. Campaign teaser tiles also use intentional focal-point crops; the actual campaign-page artwork layout is unchanged. Review saved artwork in the existing Banners preview before release. No media is rewritten, removed or uploaded automatically.

Responsive picture sources select the mobile hero first; desktop artwork is not downloaded unnecessarily on mobile. If mobile artwork fails, desktop is attempted as a fallback. If all artwork fails, the frame and saved overlay/CTA remain usable. Initial hero imagery is eager/high priority; lower imagery is lazy. Blank optional heading/support fields stay blank and do not create replacement copy over embedded artwork.

Carousel controls keep pause, previous/next and direct slide access. Existing five-second rotation pauses for focus, hover, reduced motion, hidden tabs and explicit pause. Listeners/timers are cleaned up. Public content and campaigns refresh through their existing trusted-time sources; failures remove stale promotions and expose isolated retries.

The category rail scrolls internally without widening the page. Footer padding and floating WhatsApp positioning respect mobile navigation and safe areas. Navigation drawer traps focus, locks body scroll, closes with Escape and restores trigger focus. Authentication retains its existing tablet bottom-navigation breakpoint.

Validation and release

- `src/home/model.test.tsx`: deterministic newest selection, real price/badge/card states, category fallback, bounded CMS projection.
- `scripts/homepage-browser.test.py`: actual loopback API/Auth/Firestore, widths 320/390/768/1024/1440/1920, zero/one/multiple/artwork-only/long heroes, mobile media selection/fallback, empty/error/retry isolation, guest sign-in restoration, Wishlist/Bag counts and duplicate protection, variants, unavailable products, search, drawer accessibility and sign-out isolation.
- Existing content/banner/campaign/catalog/shopping emulator tests and affected storefront/browser regressions are reused.

Synthetic fixture data and sample-asset comparisons are isolated to loopback tests and ignored `.cache` files. The fixture tool refuses non-loopback environments. No production mutations or media uploads are needed.

No new Firestore rules, indexes, serverless functions or environment variables are required. Release still requires the owner's normal code review/commit/deployment and a read-only hosted acceptance check. Real banners, assignments, campaigns, About text and contact information determine which optional sections appear. Nothing is seeded or activated in production by this work.

Focused visual correction (27 October 2026)

`src/home/visual-correction.css` scopes the correction to the homepage: centered 64px mobile header, restrained hero copy and arrow CTA, 64px collection tiles, visible icons above three short information links, compact heading/card typography and image insets. Wishlist discs are 28px visually while their buttons retain 44px hit areas. The existing desktop structure and five viewport-attached navigation tabs remain intact. Cover crops can trim unusual image edges; standard 3:4 product photos fill their cells without distortion.

When homepage category assignments are absent, `Collections.tsx` subscribes to the existing public enabled-category source. Existing assignments still determine order when present. It first uses eligible loaded product covers, then the existing public category-filtered catalogue query for missing covers. Categories have no dedicated artwork field. A category without supported photography receives a neutral palette tile; load failures have an explicit retry, and genuinely empty results stay empty. The overflow hint is shown only when the rail actually overflows. No sample category or photograph is injected into real reads.

Banner copy remains optional and authoritative. Blank heading/support fields render no replacement heading, including CTA-only artwork; that mode also omits the broad text gradient. There is no OCR or reliable embedded-text flag in the current banner schema. Arbitrary raster typography cannot be detected automatically: owners should leave optional copy blank for artwork containing text. A read-only inspection of the current public store projection found its one banner already had blank title and support fields. No saved artwork, copy, focal points, schedules or destinations were changed. The text-free Stitch textile photo is used only by isolated visual fixtures, never as a live banner replacement.

Visual comparison artifacts are in ignored `.cache/homepage-correction/`: original HTML rendered at 320px and 390px CSS widths, with aligned side-by-side screenshots against loopback fixtures. The original export assets are cached only for the comparison. Actual product titles, prices, supported badges, stock actions, category counts, saved copy and the Parinaya logo intentionally differ from prototype sample data. Information labels retain Shop Sarees / Delivery Information / Customer Support, without unsupported certification or insurance claims.

The browser regression now also checks the unassigned-category fallback, CTA-only artwork without duplicate heading/support, exact mobile header/tile sizes, 28px Wishlist disc with 44px hit area and visible information icons. Keyboard focus outlines remain available; screenshot capture blurs the test's previously focused menu button rather than removing the accessible focus indicator.

Storefront presentation update (27 October 2026)

This update supersedes the earlier shallow mobile hero and information-strip treatment above. The mobile frame uses `aspect-ratio:4/5`, without fixed heights or height clamps, for stable space before load and between slides. The existing 768px breakpoint, responsive image choice, desktop fallback, focal positions, schedules, destinations, text and carousel controls remain unchanged. Homepage information-strip markup and its styles are removed; Collections flows directly into New Arrivals with normal section padding.

`src/index.css` now registers the existing `/fonts/Lora-Variable.ttf` once, relocating the identical declaration from Admin's stylesheet. The `.customer-storefront` layout root sets Lora and its font variables. A family-only scoped override handles component shorthands and controls while preserving sizes, line heights and weights. It excludes SVGs and Material Symbols. Admin is outside this root, as are payment-provider interfaces; no new font downloads or CDN references are introduced.

The banner editor recommends 1080 x 1350px for homepage mobile artwork. Optional mobile artwork retains desktop fallback. Sale Campaign images and customer-login imagery keep their existing ratios. Image references and uploaded bytes are untouched. Differently proportioned saved artwork still uses focal-point cover cropping; important lettering or garments lost in a crop require a properly composed replacement mobile asset. CSS cannot recreate missing content. Review existing artwork in Admin's updated mobile preview before the owner's normal release.

Current validation: typecheck, 133 unit tests, production build, existing homepage browser regression (six widths) and `scripts/storefront-presentation-browser.test.py`. The latter checks 320/390/768/1440px, actual local Lora loading and computed font families across public/customer routes and controls, signed-in account/orders/addresses/checkout, hero ratio and unchanged desktop ratio, stable slide height/focal points, strip removal, no overflow, and Admin mobile preview/guidance/isolation. Earlier validation entries describe the previous visual correction; the new strip/ratio assertions supersede them.

Updated local screenshots are under ignored `.cache/storefront-presentation/`, including `home-390.png`, `home-1440.png` and registration at the four checked widths. They use isolated loopback catalogue/auth fixtures; the textile image demonstrates layout rather than promising that existing production artwork fits the new crop. Nothing was committed, pushed, deployed, uploaded or changed in production. No rules, indexes, credentials or environment changes are required.
